## Sheet Metal Forming Deep drawing

## Introduction

## Definition of sheet metal

Deep drawing is the forming of sheet blanks into hollow parts.

## Products

## mad $\mathbb{A M A A R A}$

## Deformation - stress

Role of tangential stress in wrinkling

## Deformation - stress

(a)

(b)

Complex inhomogeneous stress and strain state exists.

## Role of blank holder

If $\mathrm{D} / \mathrm{s}<20$ (thick sheet), no blank holder is needed.

Too low blank holder pressure
$\rightarrow$ wrinkling

Too high blank holder pressure $\rightarrow$ crack

## Defects

Wrinkling

Wall wrinkling

Crack

Earing

## Deep drawing without blank holder

Deep drawing with tractrix curved die without blank holder:
(a)

(b)

(c)

A tractrix is a curve for which the section of the tangent between the point of contact and the $y$-axis is constant.

## Deep drawing with heated die

For high strength and for materials with low deep drawability

## Multistep deep drawing - second step

Multistep deep drawing - reverse redrawing
a)

b)

## Blank geometry - axisymmetric part

Assuming constant surface area:

$$
\begin{aligned}
& A=\frac{D^{2} \pi}{4}=\frac{d_{m}^{2} \pi}{4}+d_{m} \pi\left(h_{m}+h^{\prime}\right) \\
& D=\sqrt{d_{m}^{2}+4 d_{m}\left(h_{m}+h^{\prime}\right)}
\end{aligned}
$$

If the workpiece consist of simple shapes

$$
\left(A_{1}, A_{2} \ldots . . A_{n}\right)
$$

$$
\begin{gathered}
A=\frac{D^{2} \pi}{4}=\sum_{i=1}^{n} A_{i}, D=\sqrt{\frac{4}{\pi} \sum_{i=1}^{n} A_{i}} \\
h / d=0,5 . .4 \mathrm{~mm}, h=20 . .300 \mathrm{~mm} \\
h^{\prime}=2-12 \mathrm{~mm}
\end{gathered}
$$

## Technology planning

Due to the material and geometric limit, not any geometry can be done in one step; The drawn cup can be formed further in other deep drawing steps. For each steps a draw ratio $m_{t}=d_{n} / d_{n-1}$ can be defined: the ratio of the diameters in the $\mathrm{n}^{\text {th }}$ and n - $1^{\text {th }}$ step.
Its maximal values is material dependent, but $\boldsymbol{m}=\mathbf{0 . 5 5 - 0 . 6}$ for the first step (forming a cup from planar blank) and $\boldsymbol{m}_{\boldsymbol{t}}=\mathbf{0 . 7 5 - 0 . 8 5}$ for the further drawing steps.
The material is characterized by a maximum total draw ratio of $\boldsymbol{q}_{\max }$.
(If $\boldsymbol{q}_{\boldsymbol{m a x}}$ is smaller, the drawability is better!)

## Blank for cylindrical pieces

1) Assuming that the surface area is constant; the surface area of the final geometry is calculated.
2) If the material is anisotropic, the cup height is increased with $5-15 \%$ depending on the anisotropy value of the material
3) The blank diameter $D$ is calculated.

## Technology planning

Knowing the maximal drawing ratio, the first diameter is $d_{l}=m D$, the further drawing diameters are: $d_{2}=m_{t} d_{1}=m_{t} m D, d_{3}=m_{t} d_{2}=m_{t}^{2} m D \ldots$

Diameter after $\boldsymbol{n}$ drawing: $d_{n}=m_{t}^{n-1} m D$

If $D$ and $d_{n}$ are known, then the number of necessary drawing steps:

$$
n=\frac{\ln d_{n}-\ln (m D)}{\ln m_{t}}+1
$$

The resulted value must be rounded up. Therefore, it is useful to continuously increase a bit the ratios from the first step to distribute the difference.

The number of drawing steps to the first annealing:

$$
k=\frac{\ln \left(1-q_{\max }\right)-\ln m}{\ln m_{t}}+1
$$

The resulted value must be rounded down.

## Blank for complex geometries

Breakdown of a rectangular hollow part into elements of equal area

## Technology planning

## Related technique - ironing

## Multistep redraw with ironing

## Die design examples

## Die design examples

## Hydro-mechanical deep drawing

## Example

Calculate the total number of drawing steps and the number of steps to the first annealing:

$$
\begin{aligned}
& d_{m}=30 \mathrm{~mm} \\
& h=70 \mathrm{~mm} \\
& s=2 \mathrm{~mm} \\
& D=? ? ? \\
& n=? ? ? \\
& \text { annealing ??? } \quad\left(\mathrm{q}_{\max }=0.5\right) \\
& (\mathrm{m}=0.6) \\
& \left(\mathrm{m}_{\mathrm{t}}=0.85\right)
\end{aligned}
$$

Thank you for your attention!
